

Top 10 Reasons to USE the SureCoat Roof System

- 1) We've Got The Best Warranty In The Business** – Most manufacturer's warranties exclude *ponding water* and are prorated to cover less every year. Our warranty is on the top, because we use superior materials and it's been tested, and proven - our system simply lasts longer. That means there are no prorated warranties and we cover ponding areas on your roof
- 2) SureCoat Is The Thickest Cool Roof That Is Title 24 Compliant** – Single component roof system on the market and it's 100% waterproof. SureCoat has been used on schools, churches, industrial buildings, government facilities and hospitals just to name a few.
- 3) SureCoat Has Ultra Violet Resistance Materials** – Which allow your roof system to protect the building structure and contents year after year - meaning minimal wear from the elements.
- 4) High Wind Resistance** – Because the system is fully adhered to the existing roof substrate it takes catastrophic damage to the building and roof substrate to impact the SureCoat Roof System. (Think Tornado?)
- 5) Easy To Install** – The system was engineered to be simple to use. The single component coating has all the adhesion and waterproof resins added in during manufacturing so you don't have to put them on in separate applications. This saves labor costs as well as takes care of adhesion concerns if you install in layers. It's the same high quality coating from bottom to top.
- 6) Roofs Can Be Done In Sections** – Can't afford to do the entire roof at once? The system allows you to do the roof in sections by just overlapping one section onto the other as funding permits.
- 7) Easy to Add on to** – Need to add some skylights or change out an HVAC unit, the system allows you to roof in those areas without any special primers or adhesives. Just clean the surrounding area and apply the system to the new equipment and the existing roof membrane.
- 8) Waterproof System** – Once fully cured the system has the ability to keep low lying areas like drain sumps and pond areas leak free. The reality of flat and low slope roofs is that they pond water in several areas around drains and waterways in particular. This is the only water based single component coating that actually performs in those conditions.
- 9) Superior Design** – We addressed the main problems we were experiencing with other roofing products and designed a better product to address those issues. The days of leaking pond areas, peeling top coats, cracking at joints and penetrations and short roof life are over.
- 10) Field Tested Technical Support** – We provide old fashion customer service to our clients based on actual field testing and years of quality performance results. Combine that with state of the art marine technology and you get the best coating system on the market.
